GENE INFORMATION

Alternative Names	CD117
Description	This gene is a protein coding gene. Exhibits cytokine binding activity; protein homodimerization activity; and transmembrane receptor protein tyrosine kinase activity. Involved in several processes, including cell surface receptor signaling pathway; positive regulation of protein phosphorylation; and protein phosphorylation. Localizes to extracellular space; fibrillar center; and plasma membrane. Implicated in several diseases, including acute myeloid leukemia; gastrointestinal stromal tumor; germ cell cancer (multiple); piebaldism; and renal cell carcinoma. Biomarker of several diseases, including Hirschsprung's disease; invasive ductal carcinoma; oxyphilic adenoma; reproductive organ cancer (multiple); and urinary system cancer (multiple).
