GENE INFORMATION

Alternative Names	FE65L; FE65L1
Description	The protein encoded by this gene interacts with the cytoplasmic domains of amyloid beta (A4) precursor protein and amyloid beta (A4) precursor-like protein 2. This protein contains two phosphotyrosine binding (PTB) domains, which are thought to function in signal transduction. Polymorphisms in this gene have been associated with Alzheimers disease. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Oct 2009]
