GENE INFORMATION

Alternative Names	ANX8; CH17-360D5.2
Description	This gene encodes a member of the annexin family of evolutionarily conserved Ca2+ and phospho lipid binding proteins. The encoded protein may function as an an anticoagulant that indirectly inhi bits the thromboplastin-specific complex. Overexpression of this gene has been associated with ac ute myelocytic leukemia. A highly similar duplicated copy of this gene is found in close proximity on the long arm of chromosome 10. [provided by RefSeq, Jul 2008]
