GENE INFORMATION

Alternative Names	ATX1; HAH1
Description	This gene encodes a copper chaperone that plays a role in copper homeostasis by binding and transporting cytosolic copper to ATPase proteins in the trans-Golgi network for later incorporation to the ceruloplasmin. This protein also functions as an antioxidant against superoxide and hydrogen peroxide, and therefore, may play a significant role in cancer carcinogenesis. Because of its cytoplasmic location, this gene represents a candidate gene for 5q-syndrome. [provided by RefSeq, Jul 2008]
