GENE INFORMATION

Alternative Names	CRT; CTR; CT-R; CTR1
Description	This gene encodes a high affinity receptor for the peptide hormone calcitonin and belongs to a sub family of seven transmembrane-spanning G protein-coupled receptors. The encoded protein is involved in maintaining calcium homeostasis and in regulating osteoclast-mediated bone resorption. Polymorphisms in this gene have been associated with variations in bone mineral density and onset of osteoporosis. Alternate splicing results in multiple transcript variants.
